

Java Thread

Thread → a process in execution.
↓

Allows program to operate more effectively by performing multiple things at a time.

↳ Complicated tasks can be performed in background without interrupting the main program.

↳ Each process can be scheduled and prioritized. - Job Scheduling

Ex: Task 1

P ₁	P ₂	P ₃	P ₄
----------------	----------------	----------------	----------------

Scheduling w.r.t time. {
P₁ - schedule (100s)
P₂ - Start ()
P₃ - Schedule (200s)
P₄ - Schedule (300s).

Task 2

P ₁	P ₂	P ₃	P ₄
----------------	----------------	----------------	----------------

"more on these in OS"

P ₄	P ₁	P ₃	P ₂
----------------	----------------	----------------	----------------

prioritizing.

Thread Life Cycle

Class: Thread

when a thread is created

NEW

Thread t = new Thread();

↓ t.start()

Ready to run.

Runnable

↓ t.run()

t.wait();
t.sleep();

process executed

Running

↓ t.stop.

Waiting/
Blocked

after some interval.

terminate

Stop

* → run() is overridden in each program.

~~~~~  
Creating Thread

inheritance

extends Thread class

Interface.

implements Runnable interface

## Extend Thread

```
public class ST extends Thread {  
    public void run() {  
        s.o.pln("This is a  
                Simple Thread");  
    }  
}  
  
p.s.v. main (String[] args) {  
    ST myThread = new ST();  
    myThread.start();  
    s.o.pln("Thread executed");  
}
```

3.

Implementing Runnable Interface.

```
public class ST implements Runnable {  
    public void run() {  
        s.o.pln("Runnable thread");  
    }  
}  
  
p.s.v. main (String args[]) {
```

ST obj = new ST();

Thread myThread = new Thread(obj);

myThread.start();

s.o Plm ("Thread executed");

}  
}

Note:

② If a class extends Thread class, the thread can be run by creating an instance of the class and call its run() method.

⑤ If a class implements the Runnable interface, the thread can be run by passing an instance of the class to a Thread object's constructor and then calling the thread's start() method.
